Project Background Information	
Authors, RPG developers, dungeon masters, and screenwriters struggle with two things: fitting an entire fictional world full of myriad characters and events into their head has its limits, and collaboration on shared canon minutiae is a struggle. This project is to build an interactive, interconnected, instructible, knowledge management system with cutting edge AI.	

¹ An overview of different research areas in the school of computer science can be found [here](#).

Requirements

The group must provide:

Worldbuilder AI — Core Requirements

Objective: Build an AI-assisted collaborative worldbuilding platform that acts as the authoritative source of truth for a large, evolving fictional universe.

The system should:

- **Maintain a structured canon** containing characters, locations, organisations, events, relationships, timelines, concepts, and other world information, including the relationships between them.
- **Support natural-language exploration**, allowing users to ask questions about the world and receive answers grounded in the established canon.
- **Support collaborative worldbuilding**, allowing users to create, edit, extend, and connect elements of the world using both conventional editing and AI assistance.
- **Protect consistency**, identifying contradictions, continuity errors, timeline conflicts, and violations of established world rules when new material is proposed.
- **Apply world and style guides**, allowing creators to define rules governing what belongs in the setting and how content associated with the world should be written.
- **Distinguish canon from proposed content**, ensuring AI-generated or user-generated material does not silently become authoritative without an appropriate approval process.
- **Maintain provenance and history**, recording how canon has changed, who or what made each change, and allowing humans to inspect previous versions.
- **Provide a human-readable view of the world**, such as an automatically maintained wiki, while retaining an auditable underlying representation that can be inspected without AI.
- **Generate new experiences from the canon**, such as stories, scenarios, characters or interactive narratives, while respecting existing world knowledge and rules.
- **Allow generated experiences to contribute back to the world**, capturing significant events or changes resulting from them as proposed additions to canon.
- **Scale conceptually to large fictional universes**, where no individual contributor could reasonably understand the entire body of canon.

Guiding principle

The AI is not the source of truth. The world is the source of truth.

AI should help users understand, navigate and evolve that world, but every canonical fact must ultimately exist in a persistent, inspectable and auditable form.

That last principle is probably the most important part of the brief: it prevents the students from solving the project by simply putting documents into a vector database and sticking a chatbot in front of it.

Skills	
<i>Highly desirable:</i> Software development Web API development Database/data modelling Applied AI/LLM	<i>Desirable:</i> Cloud fundamentals LLM integration Modern web development devops
Submission / Award information	
<i>Date of Submission:</i>	September 2026
<i>Date of Pitch:</i>	October 2026
<i>Notification of award:</i>	October 2026

For further information on this proposal, the team representative should in the first instance e-mail the lead contact stated above at the e-mail address provided.
