

Call for Expressions of Interest

<i>Date of Issue:</i>	September 2026
<i>Expected Completion Date:</i>	May 2027
<i>Project Title:</i>	Fraud Checker
<i>Company:</i>	Capital One
Contact Details	
<i>Lead Contact:</i>	Balal Hussain; Zachary Burgess
<i>Lead E-mail:</i>	balal.hussain@capitalone.com ; zacharycharles.burgess@capitalone.com
<i>Additional Contact:</i>	Ramat Abdulazeez
<i>E-mail:</i>	ramotalai.abdulazeez@capitalone.com
<i>Additional Contact:</i>	Ellie Wordsworth
<i>E-mail:</i>	ellie.wordsworth@capitalone.com
<i>Additional Contact:</i>	Qurratul Rabbi
<i>E-mail:</i>	qurratul.rabbi@capitalone.com
Additional Info	
<i>Students must sign NDA:</i>	N
<i>Project uses personal data:</i>	N
<i>Custom hardware required:</i>	N <i>If Applicable: n/a</i>
<i>Relevant research areas (if applicable)¹:</i>	Financial Fraud, Identity Verification, LLM
Project Background Information	
Project Context In the financial sector, verifying customer identities during credit account opening is vital to mitigate fraud and maintain security. As in-person branch visits decrease, the industry is shifting toward automated identity providers. Capital One aims to empower customers by delivering a fast, safe, and frictionless digital identity verification experience. Project Objective Design and build a web or mobile application component - architected to plug into existing systems via a native SDK or modular interface, that serves as an intelligent, AI-driven identity verification tool. Deliverables • Client App / SDK Module: A functional mobile or web application supporting the multi-step capture workflow. • Verification Backend: An engine or API handling ID authenticity checks, facial recognition comparison, and pass/fail/review routing logic.	

¹ An overview of different research areas in the school of computer science can be found [here](#).

- System Integration Documentation: Technical documentation outlining how the module embeds into host client applications.

Bonus Challenge: Risk-Based Adaptive Verification

Account fraud risk varies by applicant and context. Expand the application flow with adaptive risk-based logic:

- Low-Risk Applicants: Streamlined route requiring standard ID upload and selfie match.
- High-Risk Applicants: Dynamic step-up triggers requiring additional verification checks (e.g., secondary proof of address, enhanced liveness prompts, or compulsory agent review).

Requirements

The group must provide:

- Multi-Step Application Flow: Build a clear, step-by-step user interface that guides applicants through each stage of the verification process.
- Document Capture & Verification: Provide options for users to upload or scan a government-issued photo ID, with backend logic to evaluate the authenticity of the document.
- Biometric Face Match: Capture a user selfie and utilize AI matching algorithms to compare the live facial image against the photograph on the verified ID.
- Model & Agent Fallback Architecture: Implement evaluation logic where identity checks are primarily scored by an automated AI model, with a pathway to flag or route ambiguous checks to human agents for manual review.

Skills

Highly desirable:

- Development experience with differing web and mobile technologies
- Experience with unit testing and an understanding of other testing (i.e. functional/ end-to-end testing)

Desirable:

- Experience with a recognised Software development methodology (scrum, agile, kanban etc.)
- An understanding of the software development lifecycle

Submission / Award information

Date of Submission:

September 2026

Date of Pitch:

October 2026

Notification of award:

October 2026

For further information on this proposal, the team representative should in the first instance e-mail the lead contact stated above at the e-mail address provided.
