

Call for Expressions of Interest	
<i>Date of Issue:</i>	September 2026
<i>Expected Completion Date:</i>	May 2027
<i>Project Title:</i>	David and Googliath...
<i>Company:</i>	Please provide company name
Contact Details	
<i>Lead Contact:</i>	Steven Bagley
<i>Lead E-mail:</i>	steven.bagley@nottingham.ac.uk
<i>Additional Contact:</i>	Additional contact name
<i>E-mail:</i>	Additional contact e-mail
<i>Additional Contact:</i>	Additional contact name
<i>E-mail:</i>	Additional contact e-mail
<i>Additional Contact:</i>	Additional contact name
<i>E-mail:</i>	Additional contact e-mail
Additional Info	
<i>Students must sign NDA:</i>	☐
<i>Project uses personal data:</i>	☐
<i>Custom hardware required:</i>	☐
	If Applicable: Please provide details
<i>Relevant research areas (if applicable)¹:</i>	Click or tap here to enter text.
Project Background Information	
It's time to beat Google* at their own game... For many years the quality of search results across search engines has been getting worse as they try to provide the results their systems 'think' you want. This means that searching for things can often lead to page after page of useless links to shopping websites, Wikipedia, blog posts etc. instead of pages containing the information you are interested in. This wasn't always the case, go back 10—20 years and a search would often return what you were looking for within the first page, and upon it's release in the late-90s, Google was a revelation for how accurate it is search results were. The paper, 'The Anatomy of a Large-Scale Hypertextual Web Search Engine', published by Sergey Brin and Larry Page describes how Google was implemented back then. For this project, your mission should you chose to accept it is to take Segey and Larry's paper and to implement your search engine based on that design. Hopefully, this will create a search engine that can compete with the status quo. This proposal will self destruct in 30 seconds... * Other search engines are available, maybe yours will be one of them...	

¹ An overview of different research areas in the school of computer science can be found [here](#).

Requirements	
<i>The group must provide:</i> A working search engine that is implemented along the lines outlined in the paper ‘The Anatomy of a Large-Scale Hypertextual Web Search Engine’. Note This should primarily be focused on the back end of the search engine, there is no requirement for the UX to be anything other than functional. Do not waste time and effort making a pretty front end. A bonus, but non-essential requirement would be to implement this on the same hardware as they used at Stanford... Please note it is a hard requirement that large language models are not used in the implementation of the project, or to be used in writing code or the design of the project. You have real intelligence, you do not need artificial intelligence...	
Skills	
<i>Highly desirable:</i> HTML and web knowledge Database Design C/C++ Programming (or equivalent languages)	<i>Desirable:</i>
Submission / Award information	
<i>Date of Submission:</i>	September 2026
<i>Date of Pitch:</i>	October 2026
<i>Notification of award:</i>	October 2026

For further information on this proposal, the team representative should in the first instance e-mail the lead contact stated above at the e-mail address provided.
